

forecast tourist inflows. It also visualizes results with Seaborn.

```
import streamlit as st
 import pandas as pd
import numpy as np
 from sklearn.model_selection import train_test_split
 from sklearn.ensemble import RandomForestRegressor
  import seaborn as sos
 import matplotlib.pyplot as plt
 # Load dataset
 @st.cache
 def load_data():
url = "https://ppl-ai-file-upload.s3.amazonaws.com/web/direct-
files/21882887/3ff946c2-cd56-49a6-86db-
67592c1cc761/thailand_domestic_tourism.csv"
      data = pd.read_csv(url)
      data['travel_date'] = pd.to_datetime(data['travel_date'])
data['month'] = data['travel_date'].dt.month
      return data
 data = load data()
 st.sidebar.header("User Input Parameters")
province = st.sidebar.selectbox("Select Province",
data['province_eng'].unique())
 month = st.sidebar.slider("Select Month (1-12)", 1, 12, 1)
 # Filter data by province
province_data = data[data['province_eng'] == province]
 # Prepare features and target variable
X = province_data[['month', 'no_tourist_foreign', 'no_tourist_thai']]
 y = province_data['no_tourist_all']
 # Train-test split
%_train, X_test, y_train, y_test = train_test_split(X, y, test_size=0.2,
random_state=42)
 model = RandomForestRegressor(n estimators=100, random state=42)
 model.fit(X_train, y_train)
 # Predict and evaluate the model
 y_pred = model.predict(X_test)
 mse = mean_squared_error(y_test, y_pred)
st.write(f"Model Mean Squared Error: {mse:.2f}")
 # Forecast for user-selected month
forecast_input = pd.DataFrame({'month': [month], 'no_tourist_foreign':
[X['no_tourist_foreign'].mean()],
[X['no_tourist_thai'].mean()]})
 forecast = model.predict(forecast_input)[0]
st.write(f"Predicted Tourist Inflow for {province} in Month {month}:
{forecast:.0f}")
 # Visualization: Actual vs Predicted
 st.subheader("Actual vs Predicted Tourist Inflows")
fig, ax = plt.subplots()
 ax.set_ylabel("Predicted")

ax.set_ylabel("Predicted")
 ax.set_title("Actual vs Predicted Tourist Inflows")
 st.pyplot(fig)
 # Visualization: Monthly Tourist Trends
# Visualization: monthly lourist frends for {province}*)
monthly_trends = province_data.groupby('month')
['no_tourist_all'].mean().reset_index()
fig2, ax2 = plt.subplots()
sns.lineplot(data=monthly_trends, x='month', y='no_tourist_all',
marker='o', ax=ax2)
ax2.set_title(f"Monthly Trends for {province}")
ax2.set_xlabel("Month")
 ax2.set_ylabel("Average Tourists")
st.pyplot(fig2)
```

Key Features:

1. Data Loading and Preprocessing:

 The dataset is loaded from a CSV file and preprocessed to extract features like `month`.

2. Model Training:

* A `RandomForestRegressor` is trained to predict total tourist inflows based on

3. User Interaction:

. Users select a province and month to forecast tourist inflows interactively.

4. Visualizations:

- Scatter plot of actual vs predicted values.
- . Line chart showing monthly trends for the selected province.

- 1. Save the code in a file named 'app.py'.
- 2. Install required libraries: 'streamlit', 'pandas', 'numpy', 'scikit-learn', 'seaborn',
- 3. Run the app using the command: 'streamlit run app.py'.
